

Dashboard Storyline – Opportunity Pipeline and Forecast

The dashboard is structured into **two complementary sections**:

1. **Sales Pipeline Overview** – Descriptive analysis
2. **Pipeline and Forecast** – Predictive, risk, and pricing-oriented analysis

Navigation between pages is enabled through the buttons located in the top-right corner of each page (“Sales Pipeline Overview” and “Pipeline Forecast”), using **CTRL + Click**.

Technical note on Python visuals

The **Box and Whisker plot** in the *Sales Pipeline Overview* page, as well as **all charts in the Pipeline Forecast page**, were developed using **Python visuals** inside Power BI. Therefore, to render these visuals correctly, **Python and the required libraries** must be installed locally.

If Python is not available, the Power BI file will still open correctly; however, Python-based visuals will display an error, while all other transformations, DAX measures, and native visuals will function as expected.

Data ingestion and preparation (Power Query)

The data preparation process was designed with **traceability, reproducibility, and business consistency** in mind.

Key steps include:

- Removal of the pre-existing **“Amount USD”** column and full recalculation of monetary values using exchange rates. This avoids hidden calculations, improves transparency, and ensures consistent currency conversion logic across the model.
- Standardization and cleansing of text fields using functions such as:
 - Text.Upper
 - Text.Trim
 - Text.Clean
- Harmonization of categorical fields to ensure consistent grouping and filtering.

Country and Region handling

- **Country**
Country values are shown as provided by the source system. China and Hong Kong are intentionally kept as **separate countries**, preserving the original business definitions.

- **Region**
Region reflects the **commercial structure defined by the source system**, where **China is treated as a standalone commercial region**, separate from APAC.
This distinction is preserved throughout the dashboard to remain aligned with how the business operates and reports performance.

DAX modeling and visualization – Sales Pipeline Overview

The *Sales Pipeline Overview* page addresses the **descriptive analytics requirements** and provides a comprehensive view of pipeline performance.

Key elements include:

- Implementation of the **four requested task blocks**, with additional enhancements for completeness.
- KPI cards answering fundamental business questions:
 - *What is happening?*
 - *How much value is in the pipeline?*
 - *How efficiently are opportunities closing?*
- A **stage-level table** enriched with percentage contribution to better contextualize pipeline distribution.
- A **Box and Whisker plot (Python)** to analyze the distribution of sales amounts across time, revealing significant dispersion and the presence of outliers.
- **Top 5 Revenue Drivers by Primary Reason**, highlighting which business drivers contribute most to total revenue.
- **Donut charts** showing how revenue is distributed by **Region** and **Segment**, enabling quick structural comparisons.
- Time-based trend visuals (monthly and weekly) to track pipeline evolution.
- A geographic map displaying **open opportunities by country and region**.
- Slicers on the right-hand side, including **date (month) filters**, allowing flexible exploration of the data.

This page is designed to answer “**What happened and where?**”.

Predictive analysis and pricing intelligence – Pipeline Outlook and Forecast

The *Pipeline Forecast* page is intentionally structured as a **storyline**, guiding the reader from expectation to uncertainty and risk.

1. Revenue Forecast – *What may happen?*

- A **weekly revenue forecast with uncertainty bands** provides a short-term outlook under a stable pricing assumption.
- The focus is not on point estimates, but on **forecast ranges**, emphasizing uncertainty rather than false precision.

2. Revenue Volatility by Region – *How stable is demand?*

- A bar chart compares **historical revenue volatility across regions** using a scale-independent volatility metric.
- This identifies regions with more unstable revenue patterns, which increases both forecasting and pricing risk.

3. FX-Driven Pricing Risk by Region – *Where is pricing most exposed?*

- FX pricing risk is evaluated by combining **observed exchange-rate variability** with **revenue exposure**.
- The resulting comparison highlights regions where FX movements can materially affect USD-reported revenue.

Story Summary

Together, the three visuals form a coherent storyline:

- The short-term revenue outlook shows **elevated uncertainty**, suggesting cautious pricing assumptions.
- APAC shows the **highest revenue volatility**, increasing forecasting and pricing risk.
- FX-driven pricing risk is **concentrated in APAC and EMEA**, indicating that pricing strategies in these regions should explicitly account for FX exposure.

Final note

The dashboard is intentionally designed to **balance analytical depth with executive clarity**. Rather than adding complexity for its own sake, the focus is on guiding decision-makers from **pipeline performance**, to **future outlook**, and finally to **pricing-relevant risk considerations**.
